**American Biogas Council Unveils Renewable Identification Number Calculator  
For Biogas Projects**

ABC's RNG Working Group has created a unique RIN Calculator for Biogas Projects. It has features that allow you to easily input and automatically generate values. Simply input values in the boxes in the blue section and the calculator will calculate the values you input and automatically output results into boxes in the green section.

This is a valuable tool that allows you to calculate the Renewable Identification Numbers (RIN) that EPA uses to implement the Renewable Fuel Standard (RFS). Renewable Identification Numbers (RINs) are used by the EPA to track biofuel trading. RIN is generated for each volume of biofuel that is produced. As an incentive for renewable fuel production, RIN has a monetary value associated with it.

Click here to access the RIN Calculator:
